1 Introduction

The most important question in thermodynamics is, how to convert thermal energy into work. For such tasks it exist many classical engines, as example the steam-machine. To quantify heat-engines, its commen to look at the ergotropy. In my master-project I will quantify the a three level maser. The three-level maser is a Quantum heat engine (short: QHE). The work extraction from a classicle heat engine is a moving piston. But in this case it is a driving field.. Experimentally we need two different reservoir. The high-temperature reservoir can be realized by a gas noise lamp and the filter by a wave guide cutting off the lower frequencies.

2 Theory

The efficiency is given by the formula:

$$\eta_M = \frac{\nu_s}{\nu_p} \tag{1}$$

The master equation is:

$$\dot{\rho}(t) = \frac{1}{i\hbar}[H, \rho] + \mathcal{L}\rho \tag{2}$$

The interaction Hamiltonian or Jaynes-Cummings Hamiltonian is:

$$H_{int} = \hbar g(\sigma_{12} a^{\dagger} + \sigma_{21} a) \tag{3}$$

The Hamiltonian of the photons is:

$$H_{free} = \sum_{i=1}^{3} \hbar\omega_i \left|i\right\rangle \left\langle i\right| + \hbar\omega_f a^{\dagger} a \tag{4}$$

The total Hamiltonian

$$H = H_{free} + H_{int} \tag{5}$$

The interaction with the various environmental heat baths is described by the Liouvillian:

$$\begin{aligned}
\mathcal{L}\hat{\rho} = \frac{\gamma_h}{2}\left[\frac{1}{\exp[\frac{\hbar\omega_h}{k_b T_h}] - 1} + 1\right] \cdot \left(2\sigma_{13} \cdot \rho \cdot \sigma_{13}^{\dagger} - \sigma_{13}^{\dagger}\sigma_{13}\rho - \rho\sigma_{13}^{\dagger}\sigma_{13}\right) \\
+\frac{\gamma_h}{2}\left[\frac{1}{\exp[\frac{\hbar\omega_h}{k_b T_H}] - 1}\right] \cdot \left(2\sigma_{31} \cdot \rho \cdot \sigma_{31}^{\dagger} - \sigma_{31}^{\dagger}\sigma_{31}\rho - \rho\sigma_{31}^{\dagger}\sigma_{31}\right) \\
+\frac{\gamma_c}{2}\left[\frac{1}{\exp[\frac{\hbar\omega_c}{k_b T_c}] - 1} + 1\right] \cdot \left(2\sigma_{23} \cdot \rho \cdot \sigma_{23}^{\dagger} - \delta_{23}^{\dagger}\sigma_{23}\rho - \rho\sigma_{23}^{\dagger}\sigma_{23}\right) \\
+\frac{\gamma_c}{2}\left[\frac{1}{\exp[\frac{\hbar\omega_c}{k_b T_c}] - 1}\right] \cdot \left(2\sigma_{32} \cdot \rho \cdot \sigma_{32}^{\dagger} - \sigma_{32}^{\dagger}\sigma_{32}\rho - \rho\sigma_{32}^{\dagger}\sigma_{32}\right) \\
\kappa\left[\frac{1}{\exp[\frac{\hbar w_f}{k_b T_f}] - 1} + 1\right] \cdot \left(2a\rho a^{\dagger} - a^{\dagger}a\rho - \rho a^{\dagger}a\right) \\
\kappa\left[\frac{1}{\exp[\frac{\hbar w_f}{k_b T_f}] - 1}\right] \cdot \left(2a^{\dagger}\rho a - aa^{\dagger}\rho - \rho aa^{\dagger}\right)
\end{aligned} \tag{6}$$
